This document contains the *change log* for all JUnit 5 releases since 5.4 GA.

Please refer to the User Guide for comprehensive reference documentation for programmers writing tests, extension authors, and engine authors as well as build tool and IDE vendors.

# 5.5.2

Date of Release: September 8, 2019

**Scope:** Bug fixes since 5.5.1

For a complete list of all *closed* issues and pull requests for this release, consult the 5.5.2 milestone page in the JUnit repository on GitHub.

### **Overall Improvements**

- Published artifacts have been fixed regarding module descriptors.
  - Binary JAR files contain module-info.class.
  - Source JAR files contain module-info.java.
  - Javadoc JAR files contain neither module-info.class nor module-info.java.

### **JUnit Platform**

No changes.

# **JUnit Jupiter**

### **Bug Fixes**

• The JupiterTestEngine no longer crashes without executing any tests if JUnit 4 is on the classpath but Hamcrest is not. Specifically, initialization of the OpenTest4JAndJUnit4AwareThrowableCollector class longer fails if the no org.junit.internal.AssumptionViolatedException class cannot be loaded from the classpath due to a missing Hamcrest dependency.

### **JUnit Vintage**

No changes.

### 5.5.1

Date of Release: July 20, 2019

**Scope:** Bug fixes since 5.5.0

For a complete list of all *closed* issues and pull requests for this release, consult the 5.5.1 milestone page in the JUnit repository on GitHub.

# **JUnit Platform**

No changes.

# **JUnit Jupiter**

### **Bug Fixes**

• Fix test discovery and execution of inherited @Nested classes.

# **JUnit Vintage**

No changes.

## 5.5.0

Date of Release: June 30, 2019

#### Scope:

- Declarative @Timeout support
- New InvocationInterceptor extension API
- New LifecycleMethodExecutionExceptionHandler extension API
- Deprecation of script-based conditions (@EnabledIf and @DisabledIf)
- Configurable test discovery implementation for TestEngine authors
- Explicit Java module descriptors
- · Various minor improvements and bug fixes

For a complete list of all *closed* issues and pull requests for this release, consult the 5.5 M1, 5.5 RC1, 5.5 RC2, and 5.4 GA milestone pages in the JUnit repository on GitHub.

## **JUnit Platform**

### **New Features and Improvements**

- Configurable test discovery implementation that can be reused by different test engines (see Javadoc of the org.junit.platform.engine.support.discovery package).
- New isFinal() and isNotFinal() methods in ModifierSupport.

### **Bug Fixes**

• A custom ClassLoader created for additional --class-path entries passed to the ConsoleLauncher will now be closed after usage to gracefully free file handles.

### **Deprecations and Breaking Changes**

• The internal PreconditionViolationException class in concealed package org.junit.platform.commons.util is now deprecated and has been replaced by an exception class with the same name in exported package org.junit.platform.commons.

### **New Features and Improvements**

• AnnotationSupport.findRepeatableAnnotations() now finds repeatable annotations used as metaannotations on other repeatable annotations.

- New AnnotationSupport.findRepeatableAnnotations() variant that accepts a java.util.Optional<? extends AnnotatedElement> argument.
- An exception thrown by a TestExecutionListener no longer causes test execution to abort. Instead, such exceptions will be logged as warnings now.
- New MethodSource.from() variant that accepts String, String, Class<?>... as arguments.

# **JUnit Jupiter**

### **Bug Fixes**

- Execution of dynamic tests registered via a @TestFactory method no longer results in an OutOfMemoryError if the executables in the dynamic tests retain references to objects consuming large amounts of memory. Technically speaking, JUnit Jupiter no longer retains references to instances of DynamicTest after they have been executed.
- Extensions registered programmatically using <code>@RegisterExtension</code> on fields of test classes now work correctly for tests in contained <code>@Nested</code> test classes. Previously, such extensions were registered multiple times for each test method in <code>@Nested</code> classes.

### **Deprecations and Breaking Changes**

• Script-based condition APIs and their supporting implementations are deprecated with the intent to remove them in JUnit Jupiter 5.6. Users should instead rely on a combination of other built-in conditions or create and use a custom implementation of ExecutionCondition to support the same conditions.

### **New Features and Improvements**

- Support for declarative timeouts using <code>@Timeout</code> or configuration parameters (see User Guide for details).
- The JRE enum used with @EnabledOnJre and @DisabledOnJre now supports Java 14.
- Expected and actual values are now supplied for failed boolean assertions for enhanced IDE and reporting support for example, when assertTrue() or assertFalse() fails.
- New overloaded variants of Assertions.assertLinesMatch(···) that accept a String or a Supplier<String> for a custom failure message.
- Failure messages for Assertions.assertLinesMatch(···) now emit each expected and actual line in a dedicated line.
- New Kotlin-friendly assertDoesNotThrow(), assertTimeout(), and assertTimeoutPreemptively() assertions have been added as top-level functions in the org.junit.jupiter.api package.
- Parameterized tests now support implicit conversion from a String to the following java.time types: Duration, Period, MonthDay, ZoneId, and ZoneOffset.
- @ValueSource now additionally supports literal values of type boolean for parameterized tests.
- New emptyValue attribute in @CsvSource and @CsvFileSource.
- Display names for test methods generated by the ReplaceUnderscores DisplayNameGenerator no

longer include empty parentheses for test methods that do not declare any parameters.

- New junit.jupiter.displayname.generator.default configuration parameter to set the default DisplayNameGenerator that will be used unless @DisplayName or @DisplayNameGeneration is present.
- New junit.jupiter.execution.parallel.mode.classes.default configuration parameter allows to run top-level classes in parallel but their methods sequentially or vice versa (see User Guide for details).
- MethodOrderer.Random now generates a default random seed only once and prints it to the log in order to allow reproducible builds.
- Methods ordered with MethodOrderer.Random now execute using the SAME\_THREAD concurrency mode instead of the CONCURRENT mode when no custom seed is provided.
- The declared field type for an extension registered via <code>@RegisterExtension</code> is no longer required to implement an <code>Extension</code> API. It is now sufficient if the extension implementation can be assigned to the declared field type. This provides extension authors greater flexibility as well as the ability to hide implementation details of the user facing extension API.
- Private fields annotated with <code>@RegisterExtension</code> are no longer silently ignored. Instead the corresponding test class or test method will now fail with an exception informing the user of the configuration error.
- New InvocationInterceptor extension API (see User Guide for details).
- New LifecycleMethodExecutionExceptionHandler extension API for handling exceptions thrown during the execution of @BeforeAll, @BeforeEach, @AfterEach, and @AfterAll lifecycle methods (see User Guide for details).
- All methods in the TestWatcher API are now interface default methods with empty implementations.
- A custom test source for a DynamicContainer or DynamicTest may now be a method URI—for example, method:org.example.MyTestClass#myTestMethod().
- A new getOrDefault() convenience method has been added to ExtensionContext.Store.

## **JUnit Vintage**

### **New Features and Improvements**

- junit:junit is now a compile-scoped dependency of junit-vintage-engine to allow for easier dependency management in Maven POMs.
- A method that is public is now preferred over other methods with the same name in the same test class when creating a MethodSource for a JUnit 4 Description.

### 5.4.2

Date of Release: April 7, 2019

**Scope:** Bug fixes since 5.4.1

For a complete list of all *closed* issues and pull requests for this release, consult the 5.4.2 milestone page in the JUnit repository on GitHub.

### **JUnit Platform**

No changes.

# **JUnit Jupiter**

### **Bug Fixes**

• Parameterized tests no longer throw an ArrayStoreException when creating human-readable display names.

## **JUnit Vintage**

### **Bug Fixes**

• Safeguard against a Runner that only reports tests as failed but not as started or finished, such as Spock in case of failures during data-provider preparation.

### 5.4.1

Date of Release: March 17, 2019

**Scope:** Bug fixes since 5.4.0

For a complete list of all *closed* issues and pull requests for this release, consult the 5.4.1 milestone page in the JUnit repository on GitHub.

### **Overall Improvements**

• Fix Specification-Version entry in JAR manifests

# **JUnit Platform**

### **Bug Fixes**

• Restore compatibility with Android: Unsupported Pattern flags, like UNICODE\_CHARACTER\_CLASS, no longer cause class StringUtils to fail during initialization.

# **JUnit Jupiter**

### **Bug Fixes**

• Deletion of a temporary directory within a test no longer results in a test failure for a temporary directory supplied via @TempDir.

### **JUnit Vintage**

### **Bug Fixes**

• Fix reporting of finish events of intermediate containers with static and dynamic children, e.g. Spock test classes with regular and <code>QUnroll</code> feature methods in a test suite.

# 5.4.0

Date of Release: February 7, 2019

#### Scope:

- New junit-jupiter dependency-aggregating artifact for simplified dependency management in build tools
- XML report generating listener
- Test Kit for testing engines and extensions
- null and empty argument sources for @ParameterizedTest methods
- @TempDir support for temporary directories
- Custom display name generator API
- Support for ordering test methods
- Support for ordering extensions registered via @RegisterExtension
- TestWatcher extension API
- API for accessing outer test instances in ExtensionContext
- JUnit 4 @Ignore migration support
- · Improved diagnostics and error reporting
- Improved documentation and user experience in the User Guide
- Discontinuation of the junit-platform-surefire-provider
- · Various minor improvements and bug fixes

For complete details consult the 5.4.0 Release Notes online.
